2. Tara Smith, Chief
Modeling Support Branch

From: Nazrul Islam
Senior Engineer, Water Resources
Central Valley Modeling Section

Subject: Draft State Water Project Delivery Capability Report 2019

The attached report, "Draft State Water Project Delivery Capability Report 2019", is submitted for your review and approval in compliance with the requirements of Attachment B to the Monterey Plus Settlement Agreement of May 2003. Public comments will be accepted until March 1, 2020. The final report and technical addendum including future condition studies will be provided after the public comment deadline (March 2020).

Summary

This report meets the requirements of Attachment B to the Monterey Plus Settlement Agreement of May 2003. This report is intended to provide information about the key factors affecting the operation of the State Water Project (SWP) system in California, its long-term capability as a source of water for beneficial use, and an estimate of its current delivery capability.

Water provided by the SWP is a major component of the water supplies available to many SWP Contractors. State Water Contractors (SWC) consists of 29 legal entities that include cities, counties, urban water agencies, and agricultural irrigation districts. SWC's local/regional water users have long term contracts with the California Department of Water Resources (DWR) for all, or a portion of their water supply needs. Thus, the capability of water from the SWP system is an important component in the water supply planning of its recipients, and ultimately affects the amount of water available for beneficial use in California.

The availability of these water supplies may be highly variable. A sequence of relatively wet water years¹ may be followed by a varying sequence of dry or critically dry years. Having good and reliable estimates on how much water each water user under contract with DWR will receive in a given year—whether it be a wet water year, a critical year, or somewhere in between—gives Contractors a better sense of the degree to which they may need to implement increased conservation measures, or plan for new facilities or back up sources of water to meet their needs.

The geography of California and the infrastructure of water transfer from the source areas, located in the Sierra Mountain Range, to areas of demand for water makes the Sacramento-San Joaquin Delta, a key feature of the SWP's ability to deliver water to its agricultural and urban Contractors in the North Bay, the South Bay, California Central Valley, and Southern California. All but five of the 29 SWP Contractors receive water deliveries by diversions from the Delta. These water diversions are pumped by either the Harvey O. Banks or Barker Slough pumping plants.

DWR, and the United States Bureau of Reclamation (USBR), the managing entities of the two statewide systems of water transfer in California, face numerous challenges in the operation of their diversion facilities in the Delta, and are regulated by several state and federal agencies to maintain, and enhance the Delta's long-term sustainability.

Maintaining suitable quality of water flowing in the channels of the Delta for the numerous in-basin beneficial uses, and the protection of endangered and threatened fish species, are important factors of concern for the operators of the Delta export diversion facilities. Ongoing regulatory restrictions, such as those aimed at protecting the estuary's resident and migratory fish species are major challenges to a reliable, and at the same time, sustainable water delivery capability of both, SWP and the CVP systems.

Complications induced by climate change also pose the threat of increased variability in floods and droughts, and the projected sea level rise, caused by the increase in

¹ Water years start on October 1 and end on September 30 of the next year. It is the time period where precipitation totals are measured.

average temperature, complicate efforts to manage salinity levels in the channels below tide level. This could result in more frequent water quality degradation in the Delta channels.

Among the other challenges are continued subsidence of Delta islands, many of which are already below sea level, maintained by relatively unstable levee system, and the related threat of a catastrophic levee failure as water pressure increases on fragile levees.

The analyses in this report, factor in all the current regulations governing SWP and CVP operations in the Delta and upstream, and assumptions about water uses upstream in the Sacramento River and San Joaquin River watersheds.

Analyses were conducted that considered the amounts of water that SWP Contractors use, and the amounts of water they choose to hold for use in a subsequent year.

While many of the same specific assumptions on SWP operations described in the *State Water Project Delivery Capability Report 2017* remain the same in this update for 2019, notable changes include baseline model (CalSim 3.0 from CalSim II), the amendment to the Coordinated Operation Agreement (COA), modeling representation of Old and Middle River (OMR) operational criteria, and CVP and SWP operational updates. Hence, the differences between the 2017 and 2019 report can be attributed primarily to inputs on operating assumptions.

SWP Delta exports have decreased since 2005, although the bulk of the change occurred in 2009 and 2019. The former reduction is due to the federal BiOps that went into effect, restricting operations of the CVP and SWP diversion pumps. The latter reduction is due to the amended COA with accompanying project operations changes which reduced SWP exports and increased CVP exports.

The most salient findings in this report are as follows:

- Under existing conditions, the average annual delivery of Table A water estimated for this 2019 Report with the 1922-2003 flow record is 2,453 taf/year, 118 taf less than the 2,571 taf/year estimated for the 2017 Report (Table 5-3).
- The likelihood of existing-condition SWP Article 21 deliveries (supplemental deliveries to Table A water) being greater than 20 taf/year has decreased by 16% relative to the likelihood presented in the 2017 Report. However, the likelihood of Article 21 deliveries between 20-100 taf/year has increased by 18% relative to that of the 2017 Report (Figure 5-7).

Section 1

Reasons to Assess SWP Water Delivery Capability

Two major factors underscore the importance of assessing the SWP's water delivery capability: the effects of population growth on California's balance of water supply and demand, and State legislation intended to help maintain a reliable water supply.

Population Growth, Land Use, and Water Supply

California's population has grown rapidly in recent years, with resulting changes in land use. This growth is expected to continue. From 1990 to 2005, California's population increased from about 30 million to about 36 million. Based on this trend, California's population has been projected to be more than 43 million by 2030. The *California Water Plan 2018* indicates that for year 2060 conditions, based on the California Department of Finance's projections of 2010 U.S. Census data, the population is projected to be nearly 51 million—a 70% increase compared to the 1990 population.

The amount of water available in California can vary greatly from year to year. Some areas may receive 2 inches of rain a year, while others are deluged with 100 inches or more. As land uses have changed, population centers have emerged in many locations without enough local water supplies. Thus, Californians have always been faced with the problem of how best to conserve, control, and move water from areas of abundant water to areas of water need and use.

Legislation on Ensuring a Reliable Water Supply

The laws described below impose specific requirements on both urban and agricultural water suppliers. These laws increase the importance of SWP water delivery capability estimates to local and regional water purveyors.

Urban Water Management Planning Act

The Urban Water Management Planning Act was enacted in 1983 (California Water Code, Sections 10610–10656). As amended, this law requires all public urban water purveyors to adopt urban water management plans (UWMPs) every 5 years and submit those plans to DWR. DWR reviews submitted plans to report to the legislature on the status of submitted plans and for the purposes of grant eligibility requirements.

UWMPs must include an estimate of water supply and demand for a 20-year planning horizon and three water-year types, normal, single dry year and multi dry years. SWP Contractors use SWP delivery capability to estimate their long-term water supply needs from other sources available to them.

DWR publishes a guidebook to assist water suppliers prepare their urban water management plans. Guidance documents are available at:

<https://water.ca.gov/Programs/Water-Use-And-Efficiency/Urban-Water-Use-Efficiency/Urban-Water-Management-Plans>

Water Conservation Act

The Water Conservation Act of 2009 (Senate Bill X7.7, Steinberg), enacted in November 2009, includes requirements for urban and agricultural suppliers. Water suppliers report on compliance with these requirements in either the urban or agricultural water management plans. DWR reviews plans for consistency with Water Conservation Act requirements.

This law sets goals for the State of California to reduce average statewide per capita urban water use by 10% by the end of 2015, and 20% by the end of 2020. Urban (M&I) water suppliers in their 2010 UWMPs, calculated baseline water-use and set targets for 2015 and 2020. Data submitted by participating local/regional suppliers on water use reduction target compliance, show a cumulative reduction in statewide M&I water production of more than 22% during the 22-month period of June 2015 through March 2017. DWR is required to report to the Legislature on progress toward meeting the State's goal of 20% reduction by 2020.

In addition, as part of the Water Conservation Act, agricultural water suppliers with 25,000 acres or more of irrigated land were required to prepare and adopt agricultural water management plans and submit the plans to DWR by the end of 2012 and then once every five years beginning in 2015. The Act also required suppliers to measure volumetrically water deliveries to farms and base the price of water sales at least in part on the volume of water delivered. Water suppliers were required to report on water measurement and water pricing in the water management plans.

In June 2015, DWR released a guidebook for developing agricultural water management plans:

<https://cawaterlibrary.net/wp-content/uploads/2017/06/Final-2015-AWMP-Guidebook-June-2015.pdf>

Water agencies filing agricultural water management plans are listed on a Web page maintained by DWR's Water Use and Efficiency Branch:

https://wuedata.water.ca.gov/uwmp_plans.asp

Section 2

Regulatory Restrictions on SWP Delta Exports

Multiple needs converge in the Delta: the need to protect a fragile ecosystem, to support Delta recreation and farming, and to provide water for agricultural and urban needs throughout much of California. Various regulatory requirements are placed on the SWP's Delta operations to protect special-status species such as delta smelt and spring- and winter-run Chinook salmon. As a result, as described below, restrictions on SWP operations imposed by State and federal fish and wildlife agencies contribute substantially to the challenge of accurately determining the SWP's water delivery capability in any given year.

Biological Opinions on Effects of Coordinated SWP and CVP Operations

Several fish species listed under the federal Endangered Species Act (ESA) as threatened or endangered are found in the Delta. These protected species' health and the viability of their populations are impacted by various factors, including SWP and CVP operations, nonnative species, predation, Delta salinity, water quality and contaminants, sediment supply, physical alterations to the Delta, land subsidence, pelagic organism decline, methylmercury and selenium, invasive aquatic vegetation, low dissolved oxygen (DO) levels and illegal harvest.

Because of the decline of these species, the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) have issued several Biological Opinions (BiOps) since the 1990s on the effects of coordinated SWP/CVP operations on several listed species. (USFWS Biological Opinion for Delta smelt protection and NMFS Biological Opinion for salmonids, green sturgeon, and Southern Resident killer whales.)

These BiOps affect the SWP's water delivery capability for two reasons. Most notably, they include terms that restrict SWP exports in the Delta to specific amounts at certain times under certain conditions. The BiOps also include Delta outflow requirements during certain times of the year thus reducing the available supply for export or storage..

The first BiOp on the effects of SWP (and CVP) operations were issued in February 1993 (NMFS BiOp on effects of project operations on winter-run Chinook salmon) and March 1995 (USFWS BiOp on project effects on delta smelt and splittail). Among other things, the BiOps contained requirements for Delta inflow, Delta outflow, and export pumping restrictions in order to protect listed species. These requirements imposed substantial constraints on Delta water supply operations. Many were incorporated into the 1995 *Water Quality Control Plan for the San Francisco Bay/Sacramento–San Joaquin Delta*³ (1995 WQCP), as described in the “Water Quality Objectives” section, below.

³ The SWRCB is currently updating the WQCP.

The terms of the USFWS and NMFS BiOps have become increasingly restrictive over the years. In 2004 the USBR sought a new BiOp from USFWS regarding the operation of the Central Valley Project (CVP) and the State Water Project (SWP) (collectively, Projects). USFWS issued the opinion in 2005, finding that the proposed coordinated operations of the Projects were not likely to jeopardize the continued existence of the delta smelt or result in the destruction or adverse modification of its critical habitat. After judicial review, the 2005 BiOp was vacated and USFWS was ordered to prepare a new one. USFWS found that the proposed operations of the Project would result in jeopardy to the delta smelt and in December 2008 issued a Jeopardy BiOp which included a Reasonable and Prudent Alternative (RPA) with more protective export restrictions and other actions intended to protect the delta smelt.

Similarly, in 2004 NMFS issued a BiOp on the effects of the coordinated operation of the Projects on salmonids, green sturgeon, and Southern Resident killer whales and found that the proposed operations of the Projects were not likely to jeopardize the continued existence of the listed species or result in the destruction or adverse modification of their critical habitat. After judicial review, the 2004 BiOp was also vacated and NMFS was ordered to prepare a new one. In June 2009, NMFS issued a Jeopardy BiOp covering effects on winter-run and spring-run Chinook salmon, steelhead, green sturgeon, and killer whales. Like the 2008 smelt BiOp, the salmon BiOp included an RPA with more protective export restrictions and other actions intended to protect listed species.

The USFWS BiOp includes requirements on operations in all but 2 months of the year. The BiOp calls for “adaptively managed” (adjusted as necessary based on the results of monitoring) flow restrictions in the Delta intended to protect delta smelt at various life stages. USFWS determines the required target flow with the reductions accomplished primarily by reducing SWP and CVP exports. Because this flow restriction is determined based on fish location and decisions by USFWS staff, predicting the flow restriction and corresponding effects on export pumping with any great certainty poses a challenge. The USFWS BiOp also includes an additional salinity requirement in the Delta for September and October in wet and above-normal water years, calling for increased releases from SWP and CVP reservoirs to reduce salinity. Among other provisions included in the NMFS BiOp, limits on total Delta exports have been established for the months of April and May. These limits are mandated for all but extremely wet years.

The 2008 and 2009 BiOps were issued shortly before and shortly after the then Governor proclaimed a statewide water shortage state of emergency in February 2009, amid the threat of a third consecutive dry year. NMFS calculated that implementing its BiOp would reduce SWP and CVP Delta exports by a combined 5% to 7%, but DWR’s initial estimates showed an impact on exports closer to 10% in average years, combined with the effects of pumping restrictions imposed by the BiOps to protect delta smelt and other species. In 2008-2009 and periodically through the drought and for changed circumstances in 2017, CDFW issued consistency determinations under Section 2080.1 of the California Fish and Game Code. The consistency determinations stated that the USFWS and the NMFS BiOps would be consistent with the California Endangered Species Act (CESA). Thus, CDFW allowed incidental take of species listed under both the federal ESA and CESA to occur during SWP and CVP operations

without requiring DWR or the USBR to obtain a separate State-issued permit.⁴

Reinitiation of Consultation for Long-Term Operations (RoC LTO)

In August 2016, USBR and DWR requested reinitiating consultation with NMFS and USFWS on the Coordinated Long-term Operations of the CVP and SWP due to new information and science on declining listed fish species populations. In January 2019, a notice of preparation of an EIR for the Coordinated Long-Term Operations of the CVP and SWP was issued to responsible agencies and various interested parties. On October 21, 2019, the U.S. Fish and Wildlife Service and the National Marine Fisheries Service released their Biological Opinions. (https://www.fws.gov/sfbaydelta/cvp-swp/documents/10182019_ROC_BO_final.pdf). The new operations plan that has emerged includes responsive water project operations that both protect endangered fish and allow the flexibility to quickly adapt to changing conditions – like the variable weather in California – to ensure effective and efficient water supply management.

Delta Inflows

Delta inflows vary considerably from season to season, and from year to year. For example, in an above-normal year, nearly 85% of the total Delta inflow comes from the Sacramento River, more than 10% comes from the San Joaquin River, and the rest comes from the three eastside streams (the Mokelumne, Cosumnes, and Calaveras Rivers).

The type of water year is also an important factor affecting the volume of Delta inflows. When hydrology is analyzed, water years are designated by DWR as “wet” (W), “above normal” (AN), “below normal” (BN), “dry” (D), or “critical” (C). All other factors (such as upstream level of development) being equal, much less water will flow into the Delta during a dry or critical water year (that is, during a drought) than during a wet or above-normal water year. Fluctuations in inflows are a substantial overall concern for the Delta, and a specific concern for the SWP; such fluctuations affect Delta water quality and fish habitat, which in turn trigger regulatory requirements that constrain SWP Delta pumping.

Delta inflows will also vary by time of year as the amount of precipitation varies by season. About 80% of annual precipitation occurs between November and March, and very little rain typically falls from June through September. Upstream reservoirs regulate this variability by reducing flood flows during the rainy season and storing water to be released later in the year to meet regulatory requirements and water demands.

Water Quality Objectives

Because the Delta is an estuary, salinity is a particular concern. In the 1995 WQCP, the State Water Board set water quality objectives to protect beneficial uses of water in the Delta and Suisun Bay. The objectives must be met by the SWP and federal CVP as

⁴ However, CDFW stated in an October 2017 response letter to DWR that according to the evidence, the USFWS memorandum (2017 Memorandum), authorizing a change to the required location of X2 in September and October of Wet Years, would not be consistent with the California Endangered Species Act (CESA) requirements.

specified in the water right permits issued to DWR and the USBR. Those objectives—minimum Delta outflows, limits on SWP and CVP Delta exports, and maximum allowable salinity levels—are enforced through the provisions of the State Water Board's Water Right Decision 1641 (D-1641), issued in December 1999 and updated in March 2000, which implemented the 1995 WQCP.

DWR and the USBR must monitor the effects of diversions and SWP and CVP operations to ensure compliance with existing water quality standards.

Among the objectives established in the 1995 WQCP and D-1641 are the “X2” objectives. X2 is defined as the distance in kilometers from Golden Gate, where salinity concentration in the Delta is 2 parts per thousand. The location of X2 is used as a surrogate measure of Delta ecosystem health.

For the X2 objective to be achieved, the X2 position must remain downstream of Collinsville in the Delta for the entire 5-month period, and downstream of other specific locations in the Delta on a certain number of days each month from February through June. This means that Delta outflow, which among other factors controls the location of X2 must be at certain specified levels at certain times. This can limit the amount of water the SWP may pump at those times at its Harvey O. Banks Pumping Plant in the Delta.

Because of the relationship between seawater intrusion and interior Delta water quality, meeting the X2 objective can also improve water quality at Delta drinking water intakes; however, meeting the X2 objectives can require a relatively large volume of water for outflow during dry months that follow months with large storms.

The 1995 WQCP and D-1641 also established an export/inflow (E/I) ratio. The E/I ratio is designed to provide protection for the fish and wildlife beneficial uses in the Bay Delta estuary. The E/I ratio limits the fraction of Delta inflows that are exported. When other restrictions are not controlling, Delta exports are limited to 35% of total Delta inflow from February through June and 65% of inflow from July through January.

The State Water Board is updating the WQCP. Phase 1 of the WQCP update focuses on flows on the San Joaquin River and salinity objectives in the South Delta. Phase 2 focuses on new inflow requirements for the Sacramento River, its tributaries, and eastside tributaries to the Delta (the Mokelumne, Calaveras and Cosumnes rivers); new and modified Delta outflow requirements; new requirements for cold water habitat; new and modified interior Delta flow requirements; recommendations for complementary ecosystem protection actions that others should take; and adaptive management, monitoring, evaluation, special study, and reporting provisions. A primary focus of the WQCP update is on additional flows for the beneficial use of fish and wildlife. Based on the environmental documentation that has been produced up to this date by the State Water Board, it is likely that the implementation of these flow requirements will affect SWP contractor deliveries. The State Water Board issued its Substitute Environmental Document (SED), which is the equivalent of CEQA analysis, on Phase 1 in 2016 and issued its SED on Phase 2 in 2018. After these documents are finalized, the proposed changes will have to be adopted through an order of the State Water Board.

In December 2018, the SWRCB approved a plan for Phase 1 of the Water Quality Control Plan update to restore flows in the San Joaquin River and its tributaries. The plan made provisions to allow for voluntary agreements among stakeholders to apply “flow” and “non-flow” measures to meet water quality objectives and improve conditions for native fish and wildlife in the Delta.

Coordinated Operation Agreement (COA) 2018 Amendment

An amendment to COA between the Central Valley Project and State Water Project was made in 2018. Originally negotiated and signed in 1986, the COA established the shared responsibility for each project to meet water quality and regulatory standards. Since that time, the State Water Resources Control Board have imposed additional restrictions, including new Delta outflow requirements, which further restrict exports and affect CVP and SWP operations. In response to these changes, a joint review of the 1986 agreement was conducted by both projects. At the conclusion, DWR and Bureau of Reclamation agreed to amend the COA to better reflect the current regulatory environment and operations of the projects.

Incidental Take Permit (ITP)

The 2008 USFWS and 2009 NMFS Biological Opinions are consistent with CESA requirements. As such, further authorizations with respect to species listed under both ESA and CESA are no longer required. Under section 2081 of the California Fish and Game Code, DWR holds an ITP from the CDFW related to Longfin smelt. This ITP is scheduled to expire at the end of December 2019. Pursuant to section 2081, DWR intends to obtain a new ITP which covers species listed under CESA subject to incidental take through long-term operation of the SWP. These include Delta smelt, Longfin smelt, winter-run Chinook salmon and spring-run Chinook salmon. DWR has historically requested and received consistency determinations under section 2080.1 to allow for continued coordination between SWP and CVP operations.

Voluntary Agreements (VA)

The California Department of Water Resources and the Department of Fish and Wildlife (DFW) are working to establish the VA with participating water users following adoption by SWRCB of the Phase 1 updates. The VA involve the development of projects that provide flow augmentation, modified storage releases and non-flow actions such as floodplain inundation to enhance Delta conditions. Both departments are continuing the effort to develop and evaluate proposed voluntary agreements. On March 1, 2019, DWR and DFW submitted documents to the State Water Resources Control Board that reflect progress to flesh-out the previously submitted framework to improve conditions for fish through targeted river flows and a suite of habitat-enhancing projects including floodplain inundation and physical improvement of spawning and rearing areas. Further work and analysis are needed to determine whether the agreements can meet environmental objectives required by law and identified in the State Water Board's update to the Bay-Delta Water Quality Control Plan.

Section 3

Ongoing Environmental and Policy Planning Efforts

It is hard to overstate the Delta's importance to California's economy and natural heritage. The Delta supplies a large share of the water used in the state. California would not be the same without that water — hundreds of billions of dollars of economic activity depend upon it. Southern California, with half of the state's population, gets almost a quarter of its average water supply from the Delta; Kern County, which produces nearly \$3 billion annually in grapes, almonds, pistachios, milk, citrus, and carrots, depends on the Delta for about a fifth of its irrigation supply; the west side of the San Joaquin Valley also produces billions of dollars' worth of food and depends on the Delta for about three-quarters of its irrigation supply; and the San Francisco Bay Area, including the innovation hub of Silicon Valley, takes about half of its water supply from the Delta and its tributaries.

At the same time, the hundreds of miles of river channels that crisscross the Delta's farmed islands provide a migratory pathway for Chinook salmon, which support an important West Coast fishing industry. Other native fish species depend upon the complex mix of fresh and saltwater in the Delta estuary. Multiple stressors have impaired the ecological functions of the Delta, and concerns have been growing over the ability to balance the many needs of both people and the ecosystem.

In order to respond to these concerns, considerable effort by government agencies and California water community as a whole has been spent during the past several decades to study ways that the problems in the Delta can be addressed, and the more recent attention to the effects of climate change has helped the water community to realize the urgency of addressing these problems. The essential part of all these efforts has been to find a comprehensive solution that brings various, sometimes competing, interests together in a coordinated and concerted set of actions. The Delta Plan and the Bay Delta Conservation Plan (BDCP)/Delta Conveyance are two large-scale planning efforts that are in development. Once implemented, both efforts, could affect SWP water delivery capability in different ways, and at different scales.

Delta Plan

After years of concern about the Delta amid rising water demand and habitat degradation, the Delta Stewardship Council was created in legislation to achieve State-mandated coequal goals for the Delta. As specified in Section 85054 of the California Water Code:

“Coequal goals” means the two goals of providing more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. The coequal goals shall be achieved in a manner that protects and enhances the unique cultural, recreational, natural resource, and agricultural values of the Delta as an evolving place.

The Council is required to review the Delta Plan at least every five years. The first Delta Plan was adopted by the Council on May 16, 2013. The State Office of Administrative Law (OAL) approved the 14 regulations to implement the Delta Plan, which became effective with legally enforceable regulations on September 1, 2013.

To be responsive to changing circumstances and in accordance with commitments

made in the 2013 Plan, the Council amended the Delta Plan twice in 2016. The latest Delta Plan was released last April 2018 and amended January 2019. The Delta Plan contains a set of 14 regulatory policies as well as 95 recommendations, which are non-regulatory but identify actions essential to achieving the coequal goals.

The Delta Plan as adopted in 2013 called for completion of the Bay Delta Conservation Plan (BDCP). Pursuant to the Delta Reform Act of 2009, the BDCP, if it met all other requirements of law, was to be automatically incorporated into the Delta Plan. The Delta Plan also provided that if the BDCP were not approved by Jan. 1, 2016, the Council would consider amending the Delta Plan to promote options for new conveyance and storage projects and how they could be operated.

WaterFix was approved under the California Environmental Quality Act in 2017. However, the WaterFix component of the BDCP was ended in May 2, 2019 and replaced by a single tunnel project. The Council will direct staff to develop a proposed amendment to the Delta Plan regarding Delta conveyance, water storage, and the operation of both.

Bay Delta Conservation Plan (BDCP)/Delta Conveyance Project

In 2006, state and federal agencies started pursuing an ambitious and comprehensive conservation plan under Section 10 of the Endangered Species Act (ESA) and California's Natural Community Conservation Planning Act. The approach included new water conveyance facilities and sought to improve reliability of water delivery and contribute to the recovery of listed species under a single regulatory package. A draft Bay Delta Conservation Plan (BDCP) and draft EIR/EIS were released for a public comment period that began in December 2013 and closed in July 2014. While the draft EIR/EIS was out for public review several significant changes were announced by the Brown Administration and its federal partners.

Based on these project changes and in consideration of comments received on the draft EIR/EIS, state and federal agencies announced in April 2015 a change in their approach to seeking a permit for a project to improve, protect, and maintain ecosystem health, water quality, and water supplies so that the SWP and CVP are capable of reliably delivering water within a stable regulatory framework. Rather than pursue the project as a Habitat Conservation Plan (HCP), under Section 10 of the ESA, and a Natural Community Conservation Plan (NCCP), under the state's Natural Community Conservation Planning Act, the state and federal agencies chose to study additional alternatives to achieve the dual goals through implementation of new water conveyance facilities that would be built in compliance with Section 7 of the ESA and Section 2081(b) of the California ESA.

Based on this change in the permitting approach and other design modifications, DWR and the USBR released a joint Partially Recirculated Draft EIR/Supplemental Draft EIS on the Bay Delta Conservation Plan/California WaterFix for public review and comment from July 2015 through October 2015. The draft document included analysis of three new sub-alternatives as well as additional analysis and refinement of portions of the previous draft environmental document. The additional sub-alternatives do not include an HCP/NCCP, as was proposed as part of the alternatives analyzed in the

previously circulated documents. Instead, the alternative implementation strategy allows for other state and federal programs to address the long-term conservation efforts for species recovery in programs separate from the project.

The new sub-alternatives, including the previously preferred alternative known as California WaterFix (sub-alternative 4A), focused on the conveyance facility improvements necessary for the SWP and CVP to address more immediate water supply reliability needs in conjunction with ecosystem improvements to significantly reduce reverse flows and fish species impacts associated with the existing south Delta intakes.

In December of 2016, DWR and the USBR publicly released a Final EIR/EIS. The Final EIR/EIS describes the alternatives, discusses potential environmental impacts, and identifies mitigation measures that would help avoid or minimize impacts. It also provides responses to all substantive comments received on the 2013 Draft Environmental Impact Report/Environmental Impact Statement and 2015 Partially Recirculated Draft Environmental Impact Report /Supplemental Draft Environmental Impact Statement. In July 2017, DWR released a Notice of Determination and certified the Final EIR under the California Environmental Quality Act which was then approved.

Biological Assessment for CA WaterFix

Moving forward with the alternative implementation strategy (described above), in January 2016, DWR and the USBR released a draft Biological Assessment, which included a species-by-species analysis and proposed mitigation to offset and avoid potential project impacts. In August 2016, DWR and the USBR submitted a revised Biological Assessment to USFWS and NMFS to initiate formal consultation and under Section 7 of the ESA and begin the process of obtaining incidental take authorization for federally-listed species. Remaining consistent with the change in approach, in October 2016, DWR submitted a 2081 (b) application to CDFW to address incidental take of state-listed species for California ESA compliance. The incidental take analysis included in the 2081(b) application analyzes potential project impacts and provides mitigation necessary to ensure project impacts are fully mitigated. In January 2017, NMFS, USFWS, and CDFW submitted draft CA WaterFix Biological Opinion and 2081(b) mitigation analyses to the Delta Science Program's Aquatic Science Peer Review Panel. During this time, DWR and USBR assisted and coordinated with NMFS, USFW, CDFW working towards the completion of the CA WaterFix Biological Opinions and 2081(b) documents. In June 2017, NMFS and USFWS Service released their final Biological Opinions. In July 2017, CDFW issued the incidental take permit (20181(b) document).

Delta Conveyance Project

On May 2, 2019, Governor Gavin Newsom ended California WaterFix and announced a new approach to modernize Delta Conveyance through a single tunnel alternative. Governor Newsom also released Executive Order 10-19 which directed state agencies to inventory and assess the new planning for the single tunnel project. DWR then withdrew all project approvals and permit applications for California WaterFix, thus, effectively ending the twin tunnels project.

DWR is planning to release a notice of preparation (NOP) to start planning for the Delta Conveyance project. The NOP will document the intent to develop an EIR and signal the start of the scoping process. The scoping process establishes the public comment period and public meetings. The NOP will describe the proposed project objectives and the project itself.

DWR's tentative schedule for Delta Conveyance indicates that the NOP will be released soon, starting the CEQA process. A draft EIR will be available for review early 2021 and the final EIR will be released in 2022. DWR will be ensuring compliance with the federal and state ESA. Around mid-2021, DWR will work on water rights, Delta Plan consistency, and other environmental permits.

For more information, visit <https://water.ca.gov/Programs/State-Water-Project/Delta-Conveyance>.

EcoRestore

In addition to the new Section 7 permitting approach, and the previously preferred alternative, California WaterFix, Governor Brown announced the creation of the California EcoRestore program in April 2015, committing to restore more than 30,000 acres of Delta habitat by 2020, which will be implemented on an accelerated timeline independent of the proposed water conveyance facilities. This comprehensive suite of habitat restoration actions under the California EcoRestore program includes specific targets for floodplain, tidal and sub-tidal, managed wetlands, and fish passage improvements to benefit native fish species and a commitment to adaptive management. Current projects under construction include Dutch Slough, McCormack Williamson Tract, and Southport Levee Improvement.

For more information, visit <https://water.ca.gov/Programs/All-Programs/EcoRestore>.

Section 4

State Water Project Historical Deliveries (2009-2018)

Section 4 and Section 6 present the State Water Project Historical Deliveries from 2009-2018 (Calendar year). Section 4, this section, focuses on the annual minimum, maximum, and average total contractor combined deliveries during this 10-year (2009-2018) period. Section 6 of this report includes tables listing annual historical deliveries by various water classifications for each SWP Contractor for 2009–2018.

Contractor deliveries are presented as four different delivery types - Table A delivery, an Article 21 delivery, a carryover delivery, or a turnback delivery. These delivery types are briefly described below.

“Table A” Water is an exhibit to the SWP’s water supply contracts. The maximum Table A amount is the basis for apportioning water supply and costs to the SWP contractors.

Once the total amount of water to be delivered is determined for the year, all available water is allocated in proportion to each contractor’s annual maximum SWP Table A amount.

Article 21 Water (it is described in Article 21 of the water contracts) is water that SWP contractors may receive on a short-term basis in addition to their Table A water, if they request it. Article 21 water is used by many SWP contractors to help meet demands when allocations are less than 100%. The availability and delivery of Article 21 water cannot interfere with normal SWP operations.

Carryover Water is SWP water that is allocated to an SWP contractor and approved for delivery to that contractor in a given year, but not used by the end of the year. This water is exported from the Delta by the Banks Pumping Plant, but instead of being delivered to the contractor, it is stored in the SWP’s share of San Luis Reservoir, when space is available, for the contractor to use in the following year.

Turnback Pool Water SWP contractors may offer a portion of their Table A water that has been allocated in the current year and exceeds their needs to a “turnback pool,” where another contractor may purchase it. Contractors that sell their extra Table A water in a turnback pool receive payments from contractors that buy this water.

Table 4-1 lists the maximum annual SWP Table A water delivery amounts for SWP Contractors. Figure 4-1 shows that deliveries of SWP Table A water for 2009–2018 range from an annual minimum of 475 taf to a maximum of 3,100 taf, with an average of 1,871 taf. Historical deliveries of SWP Table A water over this 10-year period are less than the maximum of 4,173 taf/year.

Total historical SWP deliveries, including Table A, Article 21, turnback pool, and carryover water, range from 3,410 to 477 taf/ year, with an average of 1,963 taf/year for the period of 2009–2018 (Figure 4-2).

Table 4-1. Maximum Annual SWP Table A Water Delivery Amounts for SWP Contractors

Contractor	Maximum Table A Delivery Amounts (acre-feet)
Feather River Area Contractors	
Butte County	27,500
Yuba City	9,600
Plumas County Flood Control and Water Conservation District	2,700
Subtotal	39,800
North Bay Area Contractors	
Napa County Flood Control and Water Conservation District	29,025
Solano County Water Agency	47,756
Subtotal	76,781
South Bay Area Contractors	
Alameda County Flood Control and Water Conservation District, Zone 7	80,619
Alameda County Water District	42,000
Santa Clara Valley Water District	100,000
Subtotal	222,619
San Joaquin Valley Area Contractors	
Dudley Ridge Water District	45,350
Empire West Side Irrigation District	3,000
Kern County Water Agency	982,730
Kings County	9,305
Oak Flat Water District	5,700
Tulare Lake Basin Water Storage District	87,471
Subtotal	1,133,556
Central Coastal Area Contractors	
San Luis Obispo County Flood Control and Water Conservation District	25,000
Santa Barbara County Flood Control and Water Conservation District	45,486
Subtotal	70,486
Southern California Area Contractors	
Antelope Valley–East Kern Water Agency	144,844
Castaic Lake Water Agency	95,200
Coachella Valley Water District	138,350
Crestline–Lake Arrowhead Water Agency	5,800
Desert Water Agency	55,750
Littlerock Creek Irrigation District	2,300
Metropolitan Water District of Southern California	1,911,500
Mojave Water Agency	85,800
Palmdale Water District	21,300
San Bernardino Valley Municipal Water District	102,600
San Gabriel Valley Municipal Water District	28,800
San Geronio Pass Water Agency	17,300
Ventura County Watershed Protection District	20,000
Subtotal	2,629,544
TOTAL TABLE A AMOUNTS	4,172,786

Source: California State Water Project Bulletin 132-17.

Note: The differences in historical deliveries from those reported in the DCR 2017 are due to the State Water Project Analysis Office (SWPAO) reclassification of the various components of water delivered to the SWP Contractors.

Figure 4-1. Historical Deliveries of SWP Table A Water, 2009–2018

Note: The differences in historical deliveries from the State Water Project Delivery Capability Report 2017 are due to reclassification of the various components of water delivered to SWP Contractors

Figure 4-2. Total Historical SWP Deliveries, 2009–2018 (by Delivery Type)

Section 5

Existing SWP Water Delivery Capability (2019)

This Section presents estimates of the SWP's existing (2019) water delivery capability. The estimates are presented below, alongside the results obtained from the 2017 Report. Like this 2019 Report, the 2017 Report incorporated the requirements of BiOps issued by USFWS and NMFS in December 2008 and June 2009, respectively, on the effects of coordinated operations of the SWP and CVP. The 2019 Report also incorporates the 2018 Amendment to the COA between the CVP and SWP, which is a significant difference from the 2017 Report. The BiOps and the COA Amendment are discussed in detail in Section 2, "Regulatory Restrictions on SWP Delta Exports."

The discussions of SWP water delivery capability in this Section presents the results of DWR's updated modeling of the SWP's water delivery capability. A tabular summary of the modeling results will be presented in the Technical Addendum of this report, which will be available online at <https://water.ca.gov/Library/Modeling-and-Analysis/Central-Valley-models-and-tools/>. The Technical Addendum will contain annual delivery probability curves (i.e., exceedance plots) to graphically show the estimated percentage of years in which a given annual delivery is equaled or exceeded.

Hydrologic Sequence

SWP delivery amounts are estimated in this 2019 Report for existing conditions using computer modeling⁵ that incorporates the historic range of hydrologic conditions (i.e., precipitation and runoff) that occurred from water years 1922 through 2015. The 2019 Report is the first to use the CalSim 3 model, which is an improved version of the previously used CalSim II model. The historic hydrologic conditions are adjusted to account for land-use changes (i.e., the current level of development) and upstream flow regulations as existed in 2019, and current sea levels reflecting sea level rise. By using this 94-year historical flow record, the delivery estimates modeled for existing conditions reflect a reasonable range of potential hydrologic conditions from wet years to critically dry years. The flow record has been lengthened from the 82-year flow record (1922-2003) used in the 2017 Report. Because of the change in the length of the flow record, tables showing long-term average results for the 2019 Report distinguish between averages for 1922-2003 and for 1922-2015. The former averages are displayed because they are more directly comparable to 2017 Report results, while the latter are the final delivery amounts for this 2019 Report.

Water Year Type Definition

The Sacramento Valley 40-30-30 index is used to define the water year type. The Sacramento Valley index, previously referred to as the "4 River Index" or "4 Basin Index," is computed based on the monthly unimpaired runoff of four rivers: the Sacramento River above Bend Bridge near Red Bluff, Feather River inflow to Lake Oroville Reservoir, Yuba River at Smartville, and American River inflow to Folsom Lake.

⁵ CalSim 3 was used to perform the modeling simulations.

<https://water.ca.gov/Library/Modeling-and-Analysis/Central-Valley-models-and-tools/CalSim-3>

The Index is computed as $0.4 * \text{April-July runoff} + 0.3 * \text{October-March runoff} + 0.3 * \text{Prior Year Index}$. The Index is translated into Water Year types as shown in Table 5-1.

Table 5-1. Water year types used in the Sacramento River Index	
Sacramento Valley 40-30-30 Index	Water Year Type
≥ 9.2	Wet
7.8-9.2	Above Normal
6.5-7.8	Below Normal
5.4-6.5	Dry
≤ 5.4	Critical

Existing Demand for Delta Water

Demand levels for the SWP water users in this report are derived from historical data and information from the SWP Contractors themselves. The amount of water that the SWP contractors request each year is related to:

- The magnitude (maximum contracted amount),
- The extent of water conservation measures, in place,
- Local weather patterns, and
- Water costs.

The existing level of development (i.e., the level of water use in the source areas from which the water supply originates) is based on recent land uses and is assumed to be representative of existing conditions for the purposes of this 2019 Report.

SWP Table A Water Demands

The current combined maximum Table A amount is 4,173 taf/year. See Table 4-1 in Section 4, “State Water Project Historical Delivery Capability (2009-2018)”. Of the combined maximum Table A amount, 4,133 taf/year is the SWP’s maximum Table A water available for delivery from the Delta.

The estimated demands by SWP Contractors for deliveries of Table A water from the Delta under existing conditions is assumed to be the maximum SWP Table A delivery amount for the 2019 Report (Table 5-2), which is the same as in the 2017 Report.

Table 5-2. Comparison of Estimated Average, Maximum, and Minimum Demands for SWP Table A Water, Excluding Butte County and Yuba City (Existing Conditions, in taf/year)		
	2017 Report	2019 Report
Average	4,133	4,133
Maximum	4,133	4,133
Minimum	4,133	4,133

SWP Article 21 Water Demands

Under Article 21 of the SWP's long-term water supply contracts, Contractors may receive additional water deliveries only under the following specific conditions:

- Such deliveries do not interfere with SWP Table A allocations and SWP operations;
- Excess water is available in the Delta;
- Capacity is not being used for SWP purposes or scheduled SWP deliveries; and
- Contractors can use the SWP Article 21 water directly or can store it in their own system (i.e., the water cannot be stored in the SWP system).

The demand for SWP Article 21 water by SWP Contractors is assumed to vary depending on the month and weather conditions (i.e., amounts of precipitation and runoff). SWP Article 21 water demands used in the 2019 Report vary depending on whether it is a Kern wet year. A Kern wet year is defined as a year when the annual Kern River flow is projected to be greater than 1,500 taf. There are nine Kern wet years in the simulation period of 1922 – 2015 (1941, 1952, 1969, 1978, 1980, 1983, 1986, 1995, and 1998). Kern River inflows are important because they are a major component of the local water supply for Kern County Water Agency (KCWA), which is the second largest SWP Contractor and possesses significant local groundwater recharge capability. During Kern wet years, KCWA uses more Kern River flows to recharge its groundwater storage and reduce its demand for Article 21 water.

As shown in Figure 5-1, existing demands for SWP Article 21 water estimated for this 2019 Report are assumed to be high during the spring and late fall in Kern non-wet years (214 taf/month) because most of the irrigation districts in the Kern service area cannot rely as heavily on the Kern River flows to recharge their groundwater basins. Demand for Article 21 water is also high during the winter months of December through March in all year types (202 taf in Kern wet years and 414 taf in Kern non-wet years). Demands are assumed to be very low (2 taf/month) from April through November of Kern wet years (because high Kern River flows provide groundwater recharge water) and from July through October of Kern non-wet years.

These demand patterns for SWP Article 21 water are identical to those used in the 2017 Report, for existing conditions.

Note: Values shown are the maximum amount that can be delivered monthly. However, the actual capability of SWP water Contractors to take this amount of SWP Article 21 water is not the sum of these maximum monthly values.

Figure 5-1. SWP Article 21 Demands during Kern Wet Years and Kern Non-Wet Years (Existing Conditions)

Estimates of SWP Table A Water Deliveries

Table 5-3 presents the annual average, maximum, and minimum estimates of SWP Table A deliveries from the Delta for existing conditions, as calculated for the 2017 and 2019 Reports. Average Table A deliveries decreased in the 2019 Report compared to 2017. This was mostly due to the 2018 COA Amendments which reduced SWP exports by about 100 taf. Other factors which affected deliveries are operational updates to the SWP and CVP, the transition from using CalSim II to CalSim 3, and other miscellaneous model logic improvements.

Table 5-3. Comparison of Estimated Average, Maximum, and Minimum Deliveries of SWP Table A Water, Excluding Butte County and Yuba City (Existing Conditions, in taf/year)			
	2017 Report (1922-2003)	2019 Report (1922-2003)	2019 Report (1922-2015)
Average	2,571	2,453	2,430
Maximum	4,098	4,059	4,059
Minimum	336	513	270

Figure 5-2 shows the average annual SWP exports and Table A deliveries from the 2005 through 2019 Reports. Exports and deliveries decreased from 2005 to 2009 due to Delta regulations which constrained exports, culminating in the 2008-2009 BiOps. Average annual exports and deliveries were then relatively stable through 2017, before decreasing again in this 2019 Report due changes include baseline model (CalSim 3.0 from CalSim II), the amendment to the Coordinated Operation Agreement (COA), modeling representation of Old and Middle River (OMR) operational criteria, and CVP and SWP operational updates.

Figure 5-2. Estimated Average Annual Delta Exports and SWP Table A Water Deliveries (Excluding Butte County and Yuba City), for 2005 through 2019 Reports

Figure 5-3 presents the estimated likelihood of delivery of a given amount of SWP Table A water under the existing conditions scenario, as estimated for both the 2017 and 2019 Reports. This figure shows a 71% likelihood (77% with the 2017 Report) that more than 2,000 taf/year of Table A water will be delivered under the current estimates. This was accompanied by a shift in the distribution of the delivery ranges compared to the 2017 Report. Figure 5-3 shows substantial increases in deliveries in the 500-1,000 taf/year range, and substantial decreases in the 3,000-4,000 taf/year range.

Figure 5-3. Estimated Likelihood of SWP Table A Water Deliveries, by Increments of 500 taf (Excluding Butte County and Yuba City)

Wet-Year Deliveries of SWP Table A Water

Table 5-4 and Figure 5-4 present estimates of SWP Table A water deliveries under existing conditions during possible wet conditions and compares them with corresponding delivery estimates calculated for the 2017 Report. Wet periods for the 2019 Report are analyzed using historical precipitation and runoff patterns from 1922–2015 as a reference, while accounting for existing 2019 conditions (e.g., land use, water infrastructure). For reference, the wettest single year on the 1922-2015 record was 1983. This year had the highest historical value of the Sacramento Valley Index (37.68) and the most annual deliveries in the 2019 Report.

Table 5-4 shows results for the 2019 Report for both the 82-year and 94-year flow records. The former is shown for direct comparison to the 2017 Report results for the long-term average, and the latter is the final delivery amount for this 2019 Report. The wet period averages do not change between these two flow record periods, but an additional wet year (2011) is added that is available only in the 94-year flow record.

The results of modeling existing conditions over historical wet years indicate that SWP Table A water deliveries during wet periods can be estimated to range between yearly averages of 4,059 to 3,021 taf. The most recent wet year (2011) has deliveries of just below 1983 (4,009 taf vs 4,059 taf). Table 5-4 and Figure 5-4 show that the 2019 deliveries of SWP Table A water decreased in all wet periods in comparison to the 2017 Report. The reasons for this decrease are the same as described for Table 5-3 and Figure 5-2.

Table 5-4. Estimated Average and Wet-Period Deliveries of SWP Table A Water, Excluding Butte County and Yuba City (Existing Conditions, in taf/year), and Percent of Maximum SWP Table A Amount, 4,133 taf/year														
	Long-term Average		Single Wet Year (1983)		Single Wet Year (2011)		Wet Periods							
							2-Year (1982-1983)		4-Year (1980-1983)		6-Year (1978-1983)		10-Year (1978-1987)	
2017 Report	2,571	62%	4,098	99%	--	--	3,967	96%	3,569	86%	3,433	83%	3,163	77%
2019 Report (2003)	2,453	59%	4,059	98%	--	--	3,856	93%	3,390	82%	3,314	80%	3,021	73%
2019 Report (2015)	2,430	59%	Same		4,009	97%	Same		Same		Same		Same	

Figure 5-4. Estimated Wet-Period SWP Table A Water Deliveries (Excluding Butte County and Yuba City)

Dry-Year Deliveries of SWP Table A Water

Table 5-5 and Figure 5-5 display estimates of existing-conditions deliveries of SWP Table A water during possible drought conditions and compares them with the corresponding delivery estimates calculated for the 2017 Report. Droughts are analyzed using the historical drought-period precipitation and runoff patterns from 1922 through 2015 as a reference, although existing 2019 conditions (e.g., land use, water infrastructure) are also accounted for in the modeling. For reference, the worst multiyear drought on the 1922-2015 record was the 1929–1934 drought, although the brief drought of 1976–1977 was more intensely dry. The driest single year in terms of deliveries was 2014, though 1977 had a lower Sacramento Valley Index (3.11 vs 4.07). Deliveries were lower in 2014 due to the two preceding years being drier overall, which reduced carryover storage entering 2014.

As with the tables of wet year deliveries, long-term averages for the 2019 Report for both 82-year and 94-year flow records are shown Table 5-5. Two additional dry year periods were added that are only available in the 94-year flow record (2014 and 2014-2015).

The results of modeling existing conditions under historical drought scenarios indicate that SWP Table A water deliveries during dry years can be estimated to range between yearly averages of 270 and 1,214 taf. Table 5-5 shows that the 2019 Report deliveries of SWP Table A water decreased in many of the dry periods in comparison to the 2017

Report. The reasons for this decrease are the same as described for Table 5-3 and Figure 5-2. 1977 is the exception to this decreasing trend.

Table 5-5. Estimated Average and Dry-Period Deliveries of SWP Table A Water, Excluding Butte County and Yuba City (Existing Conditions, in taf/year) and Percent of Maximum SWP Table A Amount, 4,133 taf/year																
	Long-term Average	Single Dry Year (1977)			Single Dry Year (2014)		Dry Periods

Estimates of SWP Article 21 Water Deliveries

SWP water delivery is a combination of deliveries of Table A water and Article 21 water. Some SWP Contractors store Article 21 water locally when extra water and capacity are available beyond that needed by normal SWP operations. Deliveries of SWP Article 21 water vary not only by year, but also by month. The estimated range of monthly deliveries of SWP Article 21 water is displayed in Figure 5-6. In May through October, essentially no Article 21 water is estimated to be delivered. In the late fall and winter (November through March), maximum monthly deliveries range from 97 to 242 taf/month.

Figure 5-6. Estimated Range of Monthly Deliveries of SWP Article 21 Water (Existing Conditions)

The estimated likelihood that a given amount of SWP Article 21 water will be delivered is presented in Figure 5-7. The 68% chance of delivering 20 taf or less is less than the 84% chance in the 2017 Report. However, this does not indicate a large change in Article 21 operations, as there are a number of years where the delivery amount shifted from just below 20 taf to just above 20 taf. The chance of receiving Article 21 delivery between 20-100 taf increased by 18% as shown in Figure 5-7.

Figure 5-7. Estimated Likelihood of Annual Deliveries of SWP Article 21 Water (Existing Conditions)

Wet-Year Deliveries of SWP Article 21 Water

Table 5-6 shows the estimates of deliveries of SWP Article 21 water during wet periods under existing conditions. Estimated deliveries of SWP Article 21 water in wet years can be estimated to range between yearly averages of 102-321 taf.

Wet-period Article 21 deliveries in this 2019 Report are lower than in the 2017 Report for the long-term average and for two wet periods (1982-1983, 1978-1987), but higher for three other wet periods (1983, 1980-1983, 1978-1983).

Table 5-6. Estimated Average and Wet-Period Deliveries of SWP Article 21 Water (Existing Conditions, in taf/year)							
	Long-term Average	Single Wet Year (1983)	Single Wet Year (2011)	Wet Periods			
				2-Year Wet (1982-1983)	4-Year Wet (1980-1983)	6-Year Wet (1978-1983)	10-Year Wet (1978-1987)
2017 Report	50	273	--	183	123	86	123
2019 Report (2003)	45	321	--	171	136	102	121
2019 Report (2015)	44	Same	96	Same	Same	Same	Same

Dry-Year Deliveries of SWP Article 21 Water

Table 5-7 shows the estimates of deliveries of SWP Article 21 water during dry periods under existing conditions. Although deliveries of SWP Article 21 water are smaller during dry years than during wet ones, opportunities exist to deliver SWP Article 21 water during multiyear drought periods. As modeled, deliveries in dry years are often small (less than 20 taf); however, in the 2019 Report all drought periods can support some level of Article 21 deliveries, which are all fairly similar, except for the 1977 single dry year and 1987-1992 six-year drought period.

Table 5-7. Estimated Average and Dry-Period Deliveries of SWP Article 21 Water (Existing Conditions, in taf/year)								
	Long-term Average	Single Dry Year (1977)	Single Dry Year (2014)	Dry Periods

Section 6

Historical SWP Delivery Tables for 2009-2018

The State Water Project (SWP) contracts define several types of SWP water available for delivery to its Contractors under specific circumstances: Table A water, Article 21 water, turnback pool water, and carryover water. Many SWP Contractors frequently use Article 21, turnback pool, and carryover water to increase or decrease the amount of water available to them under SWP Table A.

Tables 6-1 through 6-10 list annual historical deliveries by SWP water type for each Contractor for 2009 through 2018. This data was obtained from SWPAO. Similar delivery tables are presented for years 2007– 2016 in the *State Water Project Delivery Capability Report 2017*. Any differences in values presented in this 2019 report and those in the 2017 report are due to reclassification of deliveries since the production of the 2017 report.
